An Example

Standard Example from the Z reference manual:
The Birthday Book

- Stores a list of names with associated birthdays
- Operations for:
    - Add new people
    - Query for a given persons birthday
    - Query for all birthdays on a given date
    - …

For the birthday book, we have to deal with two basic types:

- Names of people
- Birthday dates (day and month)

To introduce the two types, we just specify them: *[NAME, DATE]*.
